DEF A high-polymeric carbohydrate material primarily composed of amylopectin
and amylose. It is usually derived from cereal grains such as corn, wheat
and sorghum, and from roots and tubers such as potatoes and tapioca. It
includes starch which has been pregelatinized by heating in the presence
of water.

AB A method of making a carboxylated carbohydrate is disclosed, with cellulose being a preferred carbohydrate material. Carboxylated cellulose fibers, whose fiber strength and d.p. is not significantly sacrificed, can be produced. The method involves the use of a catalytic amt. of a hindered cyclic oxammonium compd. as a primary oxidant and ClO₂ as a secondary oxidant in an aq. environment. The oxammonium compds. may be formed in situ from their corresponding amine, hydroxylamine, or nitroxyl compds. The oxidized cellulose may be stabilized against d.p. loss and color reversion by further treatment with an oxidant, e.g. NaClO₂ or a ClO₂/H₂O₂ mixt. Alternatively, it may be treated with a reducing agent, e.g. NaBH₄. In the case of cellulose, the method results in a high percentage of carboxyl groups located at the fiber surface. The product is esp. useful as a papermaking fiber where it contributes strength and

has a higher attraction for cationic additives. The product is also useful as an additive to recycled fiber to increase strength. The method can be used to improve properties of either virgin or recycled cellulose pulp fibers. It does not require high .alpha.-cellulose fiber, but is suitable for regular market pulps.

AB The invention discloses the use of incensole and/or furanogermacrene, derivs. metabolites and precursors thereof in the treatment of neoplasia, particularly resistant neoplasia and immunodysregulatory disorders. These compds. can be administered alone or in combination with conventional chemotherapeutic, antiviral, antiparasite agents, radiation and/or surgery. Incensole and furanogermacrene and their mixt. showed antitumor activity against various human carcinomas and melanomas and antimicrobial activity against Staphylococcus aureus and Enterococcus faecalis.

OTHER SOURCE(S): MARPAT 134:312682

- AB A method of making highly carboxylated cellulose fibers whose fiber strength and d.p. is not significantly sacrificed comprises (1) oxidizing the cellulose fiber (kraft pulp) with a cyclic nitroxide free radical compd. as a primary oxidant and a hypohalite salt as a secondary oxidant under aq. alk. conditions; and (2) treating the oxidized cellulose against d.p. loss in aq. suspension with a stabilizing agent selected from the group consisting of reducing agent and tertiary oxidizing agent. The product is esp. useful as a papermaking fiber where it contributes strength and has a higher attraction for cationic additives, and it is also useful as an additive to recycled fiber to increase strength.

 CODEN: JMCHBD; ISSN: 0022-233X
 DOCUMENT TYPE: Journal
 LANGUAGE: English
 AB The competitive inclusions between 4-hydroxy-2,2,6,6-tetramethyl-1-
 piperidinyloxy (I) [2226-96-2] and chloro-substituted AcOH in
 composite gel, prepd. from .beta.-cyclodextrin (II) and starch in 1:2
 ratio and crosslinked by epichlorohydrin, was monitored by ESR

spectroscopy. The unusual temp. dependence of rotational correlation frequencies of I, calcd. by employing the equation of D. Kivelson (1956), suggested that gradual loosening of gel linkages occurs with an increase of temp. from 30.degree. to 60.degree.; the increment of free rotation of I was canceled by the increased amt. of I trapped in the loosened gel. The gel was a better host than II for dichloro-, monochloro-, and unsubstituted AcOH at least below 50.degree.. Trichloroacetic acid [76-03-9] was included in the gel as much as dichloroacetic acid [79-43-6], but more than monochloroacetic acid [79-11-8] and AcOH [64-19-7] which compete comparable with I inclusion.

AB In the process for producing an oxidized polysaccharide deriv. of the present invention, a polysaccharide (e.g., cellulose or starch) is pretreated to enhance its water soly. and then a primary alc. group of the pretreated polysaccharide is selectively oxidized into a carboxyl group by

hypochlorous acid or its salt in the presence of a nitroxyl compd. With such a process, a sufficient no. of carboxyl groups can be introduced into the polysaccharide without causing the cleavage of mol. chain, thereby producing the oxidized polysaccharide deriv. having an improved water absorption. The same process can be applied to the prodn. of an oxidized polyglycosamine deriv. having a sufficient no. of carboxyl groups introduced into the polyglycosamine without causing the cleavage of mol. chain, thereby producing the oxidized polyglycosamine deriv. having properties comparable to those of naturally occurring mucopolysaccharide. The pretreatment for enhancing the water soly. is effected, for example, by a gelatinization of .alpha.-bonded polysaccharide (e.g., starch), a mercerization of .beta.-bonded polysaccharide (cellulose), a carboxyalkylation or hydroxyalkylation of a hydroxy group of polysaccharide, etc. The pretreated polysaccharide may be subjected to the subsequent oxidn. after drying or immediately after the pretreatment.

AB Stable nitroxyl radicals, such as TEMPO and its derivs., used as catalysts in oxidn. reactions are recovered from oxidn. reactions by hydrophobic interactions with polymers, such as XAD resins, .beta.-cyclodextrin or silica gel. Thus, potato starch in water was treated with 4-acetamido-TEMPO and NaOCl at pH 8.5-9.5. The reaction mixt. was run through a column of silica gel, eluted with water. The 6-carboxy starch was eluted first, followed by the 4-acetamido-TEMPO which could be recycled without loss of activity.

AB The invention pertains to a process for producing oxidized cellulose having a high mol. wt., by pre-treating cellulose in a non-alk. solvent for cellulose so as to lower its crystallinity, and then oxidizing it using an oxidizing system predominantly oxidizing the 6-hydroxymethyl groups or the 2,3-dihydroxyethylene groups to carbaldehyde and/or carboxyl groups. The oxidizing agent is preferably a nitroxyl compd. (TEMPO) or periodate, and the product is useful as a water-absorbent. Thus, a phosphoric acid-regenerated cellulose (2 g) was suspended in water, TEMPO (40 mg) and NaBr (1 g) were added. Sodium hypochlorite (2 M) was added in 2 mL portions to a total of 12 mL. The pH was kept at 10.5 by addn. of 0.5 M NaOH (total addn. 20.3 mL). The temp. was kept at 4.degree. during the reaction. The total reaction time was 5.5 h. The oxidized product was completely water-sol. Na borohydride (100 mg) was added to reduce aldehyde groups. The product was then isolated by pptn., washed and dried under vacuum at room temp. (yield 2.2 g). The oxidn. degree of the product (based on sodium hydroxide consumption) was 85%. The product consisted of one monodisperse fraction with an av. mol. wt. of 410,000. The oxidized cellulose was dissolved in water (10% soln.), the pH was adjusted to 4.5 and butanediol diglycidyl ether was added (10 mol%). The crosslinking was carried out at 50.degree. for 20 h. The obtained gel was dried at 100.degree. in a fluidized bed dryer, reswollen in excess water

and dried again. The particles were ground to 100-800 .mu.m particles. The absorption under load in synthetic urine was 11 g/g. Crosslinking with divinyl sulfone resulted in even better performance than with butanediol diglycidyl ether.

AB The invention is directed to a method of making carboxylated cellulose fibers whose fiber strength and d.p. is not significantly sacrificed. The method involves the use of TEMPO (2,2,6,6-tetramethylpiperidinyloxy free radical) as a primary oxidant and a hypohalite salt as a secondary oxidant in an aq. environment. Preferably the oxidized cellulose is then stabilized against D.P. loss in alk. environments and color reversion with

a reducing agent such as sodium borohydride. Alternatively it may be treated with an oxidant such as sodium chlorite. The method results in a high percentage of carboxyl groups located at the fiber surface. The product is esp. useful as a papermaking fiber where it contributes strength and has a higher attraction for cationic additives. The product is also useful as an additive to recycled fiber to increase strength. The method can be used to improve properties of either virgin or recycled fiber. It does not require high .alpha.-cellulose fiber but is suitable for regular market pulps.

AB A method for the oxidn. of substrates comprising treating an aq., basic soln. of a substrate having an oxidizable functionality using an elemental halogen as terminal oxidant in the presence of an oxo-ammonium catalyst/halide co-catalyst system. Use of elemental halogen, preferably chlorine gas or elemental bromine, unexpectedly allows oxidn. without significant degrdn. of the substrate. The substrate is preferably a monosaccharide, oligosaccharide, or polysaccharide, and the oxidizable functionality is preferably an aldehyde, hemiacetal, or a primary alc. An effective source of the oxo-ammonium catalyst is 2,2,6,6-tetramethylpiperidiny-1-oxy (TEMPO) and a particularly economical and effective catalyst is 4-acetylamino-2,2,6,6-tetramethylpiperidiny-1-oxy. Thus, oxidn. of glucose with KBr and gaseous chlorine in aq. KOH soln. in presence of 4-acetylamino-2,2,6,6-tetramethylpiperidiny-1-oxy as catalyst gave monopotassium glutamate in 90% yield.

AB The oxidn. was carried out in the presence of a di-tertiary-alkyl nitroxyl such as 4-hydroxy-2,2,6,6-tetramethylpiperidin-1-oxyl and optional sodium hypochlorite in an aq. reaction medium at a pH < 7. The process exhibits a preference of primary over secondary alc. functions and is particularly

advantageous for oxidizing primary hydroxy groups in carbohydrates such as starch into carbaldehyde groups rather than carboxylic groups. The selectivities of primary over secondary alc. functions and of alc. to aldehyde over aldehyde to carboxylic acid can be effected by selecting specific di-tertiary-alkyl nitroxyl analogs and by carrying out the oxidn. at different conditions (temp., pH and rate of addn. of oxidizing agent). The oxidized products can be used as chelating agents for metals and the like and as absorbent materials.

AB The present invention relates to a polysaccharide having functional groups, wherein said groups are aldehyde groups formed at positions C2 and/or C3 as well as at position C6 of the anhydroglucose units of the polysaccharide chain. Preferably, the polysaccharide is a cellulosic fibrous material, the primary and secondary hydroxyl groups of which are at least partially oxidized to aldehyde groups by means of TEMPO oxidn. and periodate oxidn. The invention also relates to a paper or nonwoven comprising the above polysaccharide. According to the invention a relative wet strength of greater than 10% can be achieved.

AB Primary hydroxyl groups in aq. starch, pullulan and Me
.alpha.-D-glucopyranoside were oxidized to the corresponding carboxylic
acid functionalities by TEMPO-(4-X)-derivs. using sodium hypochlorite as
the primary oxidant. All the combinations of substrates and nitroxyl
radicals resulted in stoichiometric conversions, and the selectivity for
oxidn. of primary hydroxyls was high. Some depolymn. occurred throughout
the oxidn., esp. when 4-acetoxy and 4-mesyl-TEMPO were used. The pH
window of the activity of the inexpensive 4-acetamido-TEMPO was found to
be substantially lower from that of the other tested TEMPO-derivs.; thus
allowing milder reaction conditions. At pH 8, the rate of oxidn. was ca.
two times higher when 4-acetamido-TEMPO was used compared to the other
catalysts.

AB Paper comprising aldehyde modified cellulose pulp having selected aldehyde content is disclosed. Another embodiment involves a method of prepg. cellulose aldehydes using selective oxidn. with a limited amt. of oxidant and a nitroxyl radical mediator and defined reaction conditions to provide oxidized cellulose material with effective aldehyde content making it particularly suitable for use in making paper with desirable wet strength, temporary wet strength and dry strength properties. Thus, to a 1600 g stirred suspension of Northern softwood kraft pulp at 3% consistency (48 g pulp) was added 4.8 mg 4-acetamido-TEMPO and 0.24 g NaBr [0.01% and 0.5% on wt. of pulp (owp), resp.]. The pH of the mixt. was adjusted to 9.5 with 0.49N NaOH. Na hypochlorite (10.11 g; 9.5% soln.; 2% owp), whose pH was also adjusted to 9.5 using concd. HCl, was then added all at once and the mixt. was stirred at 25.degree. for 30 min. The pH of the suspension

was maintained throughout using a Brinkmann pH STAT 718 Titrino at 9.5 with 0.49N NaOH (7.9 mL). At the end of the treatment period, the reaction was terminated by adding ascorbic acid to the mixt. until its pH was lowered to 4.0 to 4.5 range (.apprx.1 g). The pulp was filtered and washed extensively with water whose pH was adjusted to 4.5 to 5.5. It was then either reslurried in water for subsequent use in handsheet making or dried in air at room temp. for future use.

Another embodiment involves a method of prepg. cellulose aldehydes using selective oxidn. with a limited amt. of oxidant and a nitroxyl radical mediator and defined reaction conditions to provide oxidized cellulose material with effective aldehyde content making it particularly suitable for use in making paper with desirable wet strength, temporary wet strength and dry strength properties. Thus, to a 1600 g stirred suspension of Northern softwood kraft pulp at 3% consistency (48 g pulp) was added 4.8 mg 4-acetamido-TEMPO and 0.24 g NaBr [0.01% and 0.5% on wt. of pulp (owp), resp.]. The pH of the mixt. was adjusted to 9.5 with 0.49N NaOH. Na hypochlorite (10.11 g; 9.5% soln.; 2% owp), whose pH was also adjusted to 9.5 using concd. HCl, was then added all at once and

the mixt. was stirred at 25.degree. for 30 min. The pH of the suspension was maintained throughout using a Brinkmann pH STAT 718 Titrino at 9.5 with 0.49N NaOH (7.9 mL). At the end of the treatment period, the reaction was terminated by adding ascorbic acid to the mixt. until its pH was lowered to 4.0 to 4.5 range (.apprx.1 g). The pulp was filtered and washed extensively with water whose pH was adjusted to 4.5 to 5.5. It was then either reslurried in water for subsequent use in handsheet making or dried in air at room temp. for future use.

AB Title materials comprise polysaccharides contg. 0.1-1 mmol carboxyl
 groups/1 g materials and are obtained by surface oxidn. of polysaccharide
 fibers with oxidizing agents in the presence of N-oxyl compds. Articles
 with good additive adsorption are prep'd. without effecting water retention
 and mech. properties. Thus, 10 g Kraft pulp (carboxyl content 0.06
 mmol/g) was treated with 10.5% sodium hypochlorite in the presence of
 0.025 g TEMPO and 0.25 g sodium bromide at 20.degree. for 2 h while
 maintaining pH at 10.5 with NaOH to give a cellulose fiber with max.
 carboxyl content 0.47 mmol/g, which was used to prep. a paper sheet with
 water retention <200% and tensile index >35 N-m/g.

AB Maltodextrins were oxidized to poly-glucuronic acids with the ternary oxidn. system: NaOCl-NaBr-2,2,6,6-tetramethylpiperidine-1-oxyl (TEMPO). The chemoselective oxidn. at the primary alc. groups was shown to be strongly pH dependent. Oxidn. of polysaccharides was best achieved at pH 9.5 in order to minimize depolymn., whereas oxidn. of oligosaccharides required stronger alk. conditions (pH 11-11.5). The resulting sodium polyglucuronates present interesting sequestering properties, the best of which being obtained from maltodextrins with the highest ds.p. The same oxidn. process allowed the convenient conversion of D-glucose to D-glucaric acid in high yield (>90%), under strongly basic conditions (pH>11.5).

AB Eleven different glucans (wheat starch, potato amylopectin, potato amylose, pullulan, alternan, regular comb dextran, .alpha.-cellulose, microcryst. cellulose, CM-cellulose, chitin, and chitosan) that had their C-6 primary alc. groups oxidized to carboxyl groups by reaction with 2,2,6,6-tetramethyl-1-piperidine oxoammonium ion (TEMPO), were reacted with Azotobacter vinelandii poly-.beta.-(1.fwdarw.4)-D-mannuronic acid C-5-epimerase. All of the oxidized polysaccharides reacted with the C-5-epimerase, as evidenced by comparing: (1) differences in the relative viscosities; (2) differences in the carbazole reaction; (3) differences in their susceptibility to acid hydrolysis, and (4) differences in their ability to form calcium gels, before and after reaction. We further show the formation of D-iduronic acid from D-glucuronic acid for oxidized and epimerized amylose by 2D NOESY and COSY + 1H NMR.

AB A series of pseudo amorphous cellulose samples were subjected to reaction

with catalytic amts. of 2,2,6,6-tetramethyl-1-piperidine oxoammonium salt (TEMPO), NaOCl and NaBr in H₂O. In all samples the primary alc. groups were selectively oxidized into carboxyl groups, and several H₂O-sol. polyglucuronic acid Na salts were obtained with different mol. wts. With this reaction system, the degrdn. of the amorphous cellulose samples may be minimized, provided the oxidn. is performed at 4.degree. and at const. pH 10, with controlled amts. of TEMPO and NaOCl.

AB	The title starch, useful as superabsorbent, seed and/or fertilizer carrier or soil improving agent, as material for galenicals or in adhesives and binders, is manufd. by oxidizing native starch in an acid solvent by (a) introducing 0.1-1.9 equiv (based on anhydroglucose units present in the native starch) of the oxidant in acid the starch soln., (b) carrying out the oxidn. in the presence of a catalyst contg. (i) MeReO ₃ or an alkylrhenium oxide or ReO ₃ or Re ₂ O ₇ , (ii) a di-tertiary alkyl nitroxyl, and (iii) hydrogen halide dissolved in a carboxylic acid, (c) carrying out oxidn. in H ₂ O, a carboxylic acid, an org. solvent or a mixt. contg. .gtoreq.2 of these ingredients, at 0-50.degree.. Thus, a superabsorbent was prepd. by oxidn. of starch suspended in AcOH with 30% aq. H ₂ O ₂ , in the presence of MeReO ₃ and HBr.

AB A process for producing aldehydes, and/or carboxylic acids is described, in which a primary alc., esp. a carbohydrate, is oxidized using a catalytic amt. of a nitrosonium compd. obtained by oxidizing a nitroxyl compd. in the presence of an enzyme compd. capable of oxidn. Further described are oxidized carbohydrates contg. at least 1 cyclic monosaccharide chain group carrying a carbaldehyde group per 25 monosaccharide units and per mol.

AB A cellulose-contg. fibrous material is prepd. by oxidizing hydroxy groups at the C(6) of glucose units of cellulose into aldehyde and/or carboxy groups, and used to prep. paper or nonwoven products, esp. tissue products. The paper or nonwoven products display excellent strength properties. Thus, bleached hardwood sulfite pulp was treated for 60 min under acidic conditions with 4-hydroxy-TEMPO (1.00 g/50 g dry fibrous material) using 5% of 13% NaOCl as a primary oxidizing agent, and used to prep. test sheets (basis wt. 80 g/m²) having wt. 2.56 g, breaking strength 23.94 (dry) and 4.687 N/15 mm (wet), tear length 1980.1 (dry) and 387.7 m (wet), and rel. wet strength 19.6%, compared with 3.04, 18.48, 0.151, 1285.7, 10.5, and 0.8, resp., for a nonoxidized pulp.

TITLE: Regioselective Oxidation of Hydroxyl Groups of Sugar and Its Derivatives Using Silver Catalysts Mediated by TEMPO and Peroxodisulfate in Water
 AUTHOR(S): Kochkar, H.; Lassalle, L.; Morawietz, M.; Holderich, W. F.

CORPORATE SOURCE: Department of Chemical Technology and Heterogeneous Catalysis, RWTH-Aachen, University of Technology, Aachen, 52074, Germany

AB Primary hydroxyl groups were oxidized regioselectively to carboxylic acid using org. nitrosonium salts generated on supported silver catalysts, which promote disproportionation of 2,2,6,6-tetramethylpiperidiny-1-oxy (TEMPO) in aq. soln. The oxidn. reactions were performed at pH 9.5 in a batch reactor at room temperture using heterogeneous silver catalysts and peroxides as primary co-oxidants; e.g., 99 mol% selectivity to methyl-.alpha.-D-glucopyrasiduronic acid was obtained at 90% conversion of the pyranoside using a silver carbonate-celite catalyst. The efficiency of the system was increased by adding carbonates to the silver catalyst. This result is explained by the increase of the electron charge deficiency on silver in the presence of carbonate, which accelerates the nucleophilic attack of hydroxyls and/or TEMPO. In the case of the Ag-Al2O3 catalyst, this result was proved by temp.-programmed desorption measurements using ammonia. With primary/secondary polyols, the selectivity for the primary hydroxyl groups is high. In addn., primary hydroxyl groups, as in the

case of pyranosides, were oxidized more selectively than those of the furanosides. The obsd. regioselectivity is due to the sterical hindrance caused by the four Me groups in TEMPO. (c) 2000 Academic Press.

AB Primary hydroxyl groups were oxidized regioselectively using org.
 oxoammonium salts generated on supported silver catalysts, which promote
 disproportionation of 2,2,6,6-tetramethylpiperidiny-1-oxy (TEMPO) in aq.
 soln. The oxidn. reactions were performed at pH 9.5 in a batch reactor at
 RT using heterogeneous silver catalysts and peroxides as primary
 co-oxidants. 99 Mol.% selectivity to Me .alpha.-D-glucopyranosiduronic
 acid was obtained at 90 % conversion of the pyranoside over a
 silver-celite catalyst. The activity was increased by adding carbonates
 to the silver catalysts. This result can be explained by the increase of
 the electron charge deficiency on silver in presence of carbonate, which
 accelerates the nucleophilic attack of TEMPO and/or hydroxyl groups. This
 result was proved using TPD of ammonia in the case of Ag-Al₂O₃ catalyst.
 The obsd. regioselectivity is due to the steric hindrance caused by the
 four Me groups in TEMPO.

AB A four-component system {H₂O₂, MTO [methyltrioxorhenium(VII)], HBr, TEMPO} in acetic acid catalyzes the selective oxidn. of terminal alcs. to the corresponding aldehydes with excellent selectivity and yield. The system allows the oxidn. of alcs. with hydrogen peroxide as oxidants either selectively to aldehydes or to the corresponding acids, depending on the reaction parameters. The new technique is esp. applicable to the oxidn. of carbohydrates.

AB The invention concerns a method for producing oxidized starch. According
 to the method, the starting material contg. starch is contacted with a

reagent producing oxoammonium ion, in particular 2,2,6,6,-tetramethylpiperidin-1-oxyl, in the presence of an oxidizing agent. According to the invention, an oxidative enzyme, such as laccase, is used as the oxidizing agent. By using laccase as the oxidizing agent is achieved quite selective oxidn. while avoiding the halide-contg. reagents that are considered harmful to the environment.

AB A review with 25 refs. Recent reports concerning TEMPO-mediated oxidn. of alc. compds. were introduced briefly, and application of TEMPO-NaBr-NaClO oxidn. systems under aq. conditions to cellulosic materials was reviewed on the basis of the results obtained in our lab. When mercerized and regenerated celluloses were used as starting materials, water-sol. oxidized products were quant. obtained by the TEMPO-NaBr-NaClO oxidn. at pH 10-11. ¹³C-NMR anal. showed that the oxidized products had almost pure structures of .beta.-1,4-linked glucuronic acid sodium salt, i.e. cellouronic acid Na salt. On the other hand when native celluloses were oxidized, the products did not become water-sol., owing to low degree of oxidn. Possibilities to utilize cellouronic acid and partly oxidized pulp fibers by the TEMPO-NaBr-NaClO system are discussed on the basis of their characteristics.

AB Title derivs., whose primary OH in glucose residue is oxidized to form glucuronic acid residue, are manufd. from alkali-treated or regenerated cellulose by oxidn. using oxidizing agents in the presence of N-oxyl compds. I (A = nonarom. 5- or 6-member heterocycle; A may contain hetero atom. other than N). The derivs., having high hydrophilicity or water soly., can be manufd. in mild conditions. Thus, 1 g bleached pulp was suspended in 100 g 17.5% aq. NaOH at room temp. for 2 h and neutralized to give alkali-treated cellulose, 0.5 g (bone dry wt.) of which was dispersed in 100 mL aq. soln. contg. 0.02 g TEMPO and 0.24 g NaBr and oxidized by 4.6 g NaOCl (Anriformin) at pH 10-11 and room temp. for 50 min to give title deriv. The aq. soln. contg. 1% of the derivs. looked completely transparent.

AB	The title ethers or their mixts. with a d.p. of .gtoreq.10 possess an excellent sequestering and anticrustation activity and are used as biodegradable (no data) additives in cleaning agents. The ethers are manufd. by selective oxidn. of at least a part of the primary OH groups of polymeric carbohydrate ethers with d.p. .gtoreq.10. The oxidn., e.g., of carboxymethyl or hydroxyethyl starch, CMC, etc., is carried out with NaOCl utilizing a catalytic amt. of stable nitroxide radicals, specifically 2,2,6,6,-tetramethylpiperidine-N-oxyl, and optionally, NaBr.

DOCUMENT TYPE: Journal
LANGUAGE: English

AB The primary alc. groups of ten polysaccharides, with widely different structures and water solubilities, were oxidized to carboxyl groups using 2,2,6,6-tetramethyl-1-piperidine oxoammonium ion (TEMPO; 2,2,6,6-tetramethyl-1-piperidinyloxy) at pH 10.8 and 0.degree.C. The yield and selectivity for the primary alc. group were high for all ten of the polysaccharides. The oxidn. greatly increased the water-soly. of the polysaccharides. Water-insol. polysaccharides such as amylose, cellulose, and chitin became water-sol. to the extent of approx. 10% (w/v). The water-sol. polysaccharides had their degree of soly. doubled or tripled. The specific optical rotation, viscosity, and gelling properties with calcium ion were detd. The oxidized polysaccharides are new anionic polymers with unique structures that could have application as gums, gels, and films.

AB With catalytic amts. of 2,2,6,6-tetramethyl-1-piperidinyloxy (TEMPO) and
 hypochlorite/bromide as the regenerating oxidant in water, primary alc.
 groups in glucans and derivs. thereof were rapidly and completely
 oxidized. For pyranosides, selectivity was higher than 95% and no side
 products could be detected with ¹H and ¹³C NMR or with high-performance
 anion-exchange chromatog. (HPAEC). The optimum pH for the reaction was
 between 10 and 11. The oxidn. was found to be first order in TEMPO and
 Br-. The oxidn. method can be applied to det. the amt. of primary alc.
 groups in water-sol. glucans; for pullulan, a proportion of 70% and for
 dextran, a proportion of 3% primary alc. groups was found.

AB Diamagnetic and paramagnetic amino derivs. of cellulose were prepd. via the reductive amination of 2-oxy-6-O-tritylcellulose (I) and 3-oxycellulose (II) in the presence of Na cyanoborohydride. Conversion of II into a highly branched, H₂O-sol. 3-deoxycellulose deriv. was accomplished by attachment of glucosamine side chains. 3-Amino-3-deoxycellulose with substitution degree (SD) 0.3 was obtained by reductive amination of II with AcONH₄. An organometallic cellulose deriv. was prepd. by condensation of II with (p-toluidine)tricarboxylchromium; similarly, 1,10-diaza-18-crown-6 was added to I to form a crown ether deriv. of cellulose with SD 0.06.

LANGUAGE: English

AB Nitroxide spin labels have been employed as model reagents for evaluating
 several aspects of the synthesis of covalently modified polysaccharide
 derivs. using alginic acid, xanthan gum, and cellulose as examples.
 Modifications were accomplished both nonspecifically, by the alkylation of
 OH groups, and specifically, either by direct transformation of the
 carboxylate function of alginic acid and xanthan gum or after introduction
 of appropriate prominent functions, such as aldehydes or amines. The
 products were characterized by ESR and other spectroscopic techniques.
